Superintendent Kent Mutchler  
18205 Aberdeen St  
Homewood, Illinois 60430 2417

Dear Superintendent Mutchler,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Jason Pearson  
1 Virginia Rd  
Crystal Lake, Illinois 60014 7901

Dear Superintendent Pearson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Scott Wakeley  
307 N Sangamon Ave  
Gibson City, Illinois 60936 1255

Dear Superintendent Wakeley,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. May 25, 2018

Superintendent Charles Stegall  
400 N Highland St  
Creve Coeur, Illinois 61610 3137

Dear Superintendent Stegall,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent Mark Cross  
307 Salem St  
Rockton, Illinois 61072 2630

Dear Superintendent Cross,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. - 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Rich Faivre  
PO Box 369  
Mc Leansboro, Illinois 62859 0369

Dear Superintendent Faivre,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Lostant, Illinois 61334 9021

Dear Superintendent Misener,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Cleve Threadgill  
502 W Mulberry St  
Georgetown, Illinois 61846 1846

Dear Superintendent Threadgill,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. - 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Julie Schmidt  
9400 Southwest Hwy  
Oak Lawn, Illinois 60453 2372

Dear Superintendent Schmidt,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Julie Brea  
102 S Merritt St  
Odin, Illinois 62870 1112

Dear Superintendent Brea,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Robert Gold  
306 Virginia Ave  
Carterville, Illinois 62918 1239

Dear Superintendent Gold,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. Superintendent Lonny Lemon  
121 E Sheridan Pl  
Lake Bluff, Illinois 60044

Dear Superintendent Lemon,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Michael Lubelfeld  
517 Deerfield Rd  
Deerfield, Illinois 60015 4408

Dear Superintendent Lubelfeld,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. May 25, 2018

Superintendent John Petzke  
609 S Sparta St  
Steeleville, Illinois 62288 2130

Dear Superintendent Petzke,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Stan Adcock  
505 N Park St  
Liberty, Illinois 62347 1107

Dear Superintendent Adcock,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Jerry Farris  
2921 Illinois Rd  
Wilmette, Illinois 60091 1103

Dear Superintendent Farris,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Dear Superintendent Jancek,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Laura Irwin  
4721 Shawnee College Rd  
Ullin, Illinois 62992 2201

Dear Superintendent Irwin,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. - 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Paul Fregeau  
806 N 1st St  
Fairfield, Illinois 62837 2458

Dear Superintendent Fregeau,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Jay Goble  
19189 Bailey St  
Marion, Illinois 62959 7355

Dear Superintendent Goble,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Warletta Brookins  
129 Douglas St  
Centralia, Illinois 62801 2129

Dear Superintendent Brookins,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Virgil Moore  
PO Box 200  
Niantic, Illinois 62551 0200

Dear Superintendent Moore,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

Superintendent Brad Detering  
1110 S Villa Ave  
Villa Park, Illinois 60181 3326

Dear Superintendent Detering,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Patrick Twomey  
PO Box 890  
Saint Joseph, Illinois 61873 0890

Dear Superintendent Twomey,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Brian Coleman  
75 1250th St  
Middletown, Illinois 62666 9734

Dear Superintendent Coleman,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Dear Superintendent Lind,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Mark Daniel  
200 N Maple St  
Itasca, Illinois 60143 1722

Dear Superintendent Daniel,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Matthew Brue  
PO Box 27  
Okawville, Illinois 62271 0027

Dear Superintendent Brue,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. Superintendent Gina Segobiano  
211 W Mill St  
Millstadt, Illinois 62260 1147

Dear Superintendent Segobiano,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). May 25, 2018

Superintendent Scott Doerr  
1200 S Dunton Ave  
Arlington Heights, Illinois 60005 3111

Dear Superintendent Doerr,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Thomas Mahoney  
884 W Nippersink Rd  
Round Lake, Illinois 60073 3701

Dear Superintendent Mahoney,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). May 25, 2018

Superintendent Matt Zilm  
PO Box 107  
Grand Chain, Illinois 62941 0107

Dear Superintendent Zilm,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Dear Superintendent Allison,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Randall Merker  
201 Chicago St  
Marseilles, Illinois 61341 2058

Dear Superintendent Merker,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. - 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Tim OLeary  
300 4th St  
Venice, Illinois 62090 1015

Dear Superintendent OLeary,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Janet Gladu  
1700 W Cherry St  
Marion, Illinois 62959 1212

Dear Superintendent Gladu,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Stephanie Mulholland  
1910 W 170th St  
Hazel Crest, Illinois 60429 1363

Dear Superintendent Mulholland,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Kristin Humphries  
260 Madison St  
Oak Park, Illinois 60302 4112

Dear Superintendent Humphries,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Perry Miller  
1463 N 33rd Rd  
Ottawa, Illinois 61350 9622

Dear Superintendent Miller,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). May 25, 2018

Superintendent Michael Oberhaus  
401 Chaffer Ave  
Roxana, Illinois 62084 1125

Dear Superintendent Oberhaus,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent Arthur Culver  
210 S Church Rd  
Bensenville, Illinois 60106 2303

Dear Superintendent Culver,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Scott Harres  
PO Box 215  
Augusta, Illinois 62311 0215

Dear Superintendent Harres,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Taylor Ridge, Illinois 61284 9719

Dear Superintendent Sauer,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Jilinda Larson  
16100 W 127th St  
Lemont, Illinois 60439 7462

Dear Superintendent Larson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Beau Fretueg  
728 W North St  
Grayville, Illinois 62844 1338

Dear Superintendent Fretueg,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Darrell Gordon  
1013 North St  
Mazon, Illinois 60444 6236

Dear Superintendent Gordon,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Susan Kovacs  
100 W Dixie Hwy  
Saint Anne, Illinois 60964 7276

Dear Superintendent Kovacs,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent Robert Prusator  
1401 Flagg Rd  
Rochelle, Illinois 61068 6400

Dear Superintendent Prusator,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

May 25, 2018

Superintendent Andrew Brooks  
PO Box 189  
Kinmundy, Illinois 62854 0189

Dear Superintendent Brooks,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Shelly Clover-Hill  
119 N Garden St  
Mount Pulaski, Illinois 62548 1285

Dear Superintendent Clover-Hill,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Jean Neal  
200 N Wolcott St  
Thornton, Illinois 60476 1254

Dear Superintendent Neal,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Dear Superintendent Mulvaney,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Scott Fuhrhop  
1500 McDaniel Ave  
Evanston, Illinois 60201 3976

Dear Superintendent Fuhrhop,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. - 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent David Mills  
6611 171st St  
Tinley Park, Illinois 60477 3514

Dear Superintendent Mills,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Brad Lee  
1105 N Hunt Club Rd  
Gurnee, Illinois 60031 2418

Dear Superintendent Lee,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Darryl Hogue  
925 S Giant City Rd  
Carbondale, Illinois 62902 5056

Dear Superintendent Hogue,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. Superintendent James Mitchem  
114 W 144th St  
Riverdale, Illinois 60827 2703

Dear Superintendent Mitchem,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Russell Ragon  
910 Woodlawn Ave  
Ford Heights, Illinois 60411 2299

Dear Superintendent Ragon,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

Superintendent Lane Abrell  
633 County Highway 22  
Cowden, Illinois 62422 4104

Dear Superintendent Abrell,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Timothy Baldermann  
1500 Case St  
Centralia, Illinois 62801 5050

Dear Superintendent Baldermann,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Joseph Salmieri  
2101 6th Ave  
Rock Island, Illinois 61201 8909

Dear Superintendent Salmieri,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Andy Siegfried  
600 Louisa Ave  
Dupo, Illinois 62239 1469

Dear Superintendent Siegfried,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. - 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Keith Oates  
525 N 3rd St  
Girard, Illinois 62640 1157

Dear Superintendent Oates,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Princeton, Illinois 61356 9552

Dear Superintendent Heiar,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Robert Bardwell  
804 W Knob St  
Waltonville, Illinois 62894 2812

Dear Superintendent Bardwell,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin  
United States Senator

Tammy Duckworth  
United States Senator
