

May 25, 2018

Superintendent Kelle Bunch  
2245 W Pershing Rd  
Chicago, Illinois 60609 2211

Dear Superintendent Bunch,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Wes Olson  
2317 E Lincolnway Ste A  
Sterling, Illinois 61081 3059

Dear Superintendent Olson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Chris Dougherty  
2 Friendship Plz  
Addison, Illinois 60101 2787

Dear Superintendent Dougherty,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Jay McCracken  
1520 N Bloomington St  
Streator, Illinois 61364 1312

Dear Superintendent McCracken,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Tim Smith  
606 W North St  
Auburn, Illinois 62615 1144

Dear Superintendent Smith,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Brian Brooks  
400 S Elm St  
Centralia, Illinois 62801 3910

Dear Superintendent Brooks,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Barbara Thompson  
125 W Ellsworth St  
Westville, Illinois 61883 1233

Dear Superintendent Thompson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Elmwood, Illinois 61529 9454

Dear Superintendent Rogers,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Kevin Meyer  
14025 S Harrison Ave  
Posen, Illinois 60469 1022

Dear Superintendent Meyer,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent Tom Siegler  
920 N Illinois St  
Belleville, Illinois 62220 4374

Dear Superintendent Siegler,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Superintendent Todd Vilaro  
1919 Caton Farm Rd  
Crest Hill, Illinois 60403 1700

Dear Superintendent Vilaro,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Carmen Ayala  
651 S Morgan St  
Virginia, Illinois 62691 1547

Dear Superintendent Ayala,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent David Katzin  
100 S Brainard Ave  
La Grange, Illinois 60525 2101

Dear Superintendent Katzin,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Margaret Longo  
12809 S McVickers Ave  
Palos Heights, Illinois 60463 2351

Dear Superintendent Longo,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Chicago Heights, Illinois 60411 3412

Dear Superintendent Reynolds,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent David Schuler  
999 Kedzie Ave  
Flossmoor, Illinois 60422 2248

Dear Superintendent Schuler,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Kenneth Wallace  
503 Pine St  
Marshall, Illinois 62441 1467

Dear Superintendent Wallace,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Kevin Anderson  
1400 13th St  
Carlyle, Illinois 62231 1011

Dear Superintendent Anderson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Kate Donegan  
7925 Janes Ave  
Woodridge, Illinois 60517 3821

Dear Superintendent Donegan,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

Superintendent Brian Ganan  
21191 Shawneetown Rd  
Thompsonville, Illinois 62890 1035

Dear Superintendent Ganan,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent James Garwood  
4626 State Highway 154  
Sesser, Illinois 62884 2277

Dear Superintendent Garwood,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Rushville, Illinois 62681 1048

Dear Superintendent Harting,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Thomas Hurlburt  
593 Ava Rd  
Murphysboro, Illinois 62966 4267

Dear Superintendent Hurlburt,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Jennifer Kelsall  
PO Box 190  
Crescent City, Illinois 60928 0190

Dear Superintendent Kelsall,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Superintendent Carol Kunst  
809 E Main St  
Knoxville, Illinois 61448 1536

Dear Superintendent Kunst,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Alexandra Nicholson  
804 W Main St  
Mount Olive, Illinois 62069 1549

Dear Superintendent Nicholson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Kim Petrasek  
815 Locust St  
Red Bud, Illinois 62278 1210

Dear Superintendent Petrasek,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Dear Superintendent Russell,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Jeff Stawick  
304 E Almond Dr  
Washington, Illinois 61571 3104

Dear Superintendent Stawick,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. - 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

May 25, 2018

Superintendent Brad Voehringer  
808 Adams St  
Lockport, Illinois 60441 3710

Dear Superintendent Voehringer,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Superintendent Julie Kraemer  
7540 S 86th Ave  
Justice, Illinois 60458 1168

Dear Superintendent Kraemer,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent William Mattingly  
2000 Lewis Ave  
North Chicago, Illinois 60064 2543

Dear Superintendent Mattingly,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Curt Nettles  
829 W Main St  
Carlinville, Illinois 62626 1261

Dear Superintendent Nettles,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

May 25, 2018

Superintendent Kevin Carey  
PO Box 377  
Pana, Illinois 62557 0377

Dear Superintendent Carey,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent Patrick Broncato  
1300 Hawthorn Rd  
Salem, Illinois 62881 1001

Dear Superintendent Broncato,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

May 25, 2018

Superintendent Melissa Kaczowski  
405 S Gladstone Ave  
Aurora, Illinois 60506 5309

Dear Superintendent Kaczowski,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Emily Tammaru  
1050 S 4th Ave Ste 200  
Morton, Illinois 61550 2502

Dear Superintendent Tammaru,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Henry Thiele  
PO Box 320  
Roanoke, Illinois 61561 0320

Dear Superintendent Thiele,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Lorraine Bailey  
PO Box 104  
Albers, Illinois 62215 0104

Dear Superintendent Bailey,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Jeffrey Fritchtnitch  
211 W Robinson St  
Carmi, Illinois 62821 1640

Dear Superintendent Fritchtnitch,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Robert Donkin  
1900 E Kensington Rd  
Mt Prospect, Illinois 60056 1924

Dear Superintendent Donkin,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Superintendent Aaron Mattox  
310 James St  
Barrington, Illinois 60010 3329

Dear Superintendent Mattox,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. Superintendent Jeanne Davis  
1560 Bloomingdale Rd  
Glendale Heights, Illinois 60139 2734

Dear Superintendent Davis,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Superintendent Angela Simmons  
501 Warrior Way  
Athens, Illinois 62613 9473

Dear Superintendent Simmons,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Michael Perrott  
300 S Cedar Bluff Dr  
Valmeyer, Illinois 62295 3133

Dear Superintendent Perrott,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Vicki Hardy  
921 Creamery Hill Rd  
Dallas City, Illinois 62330 1216

Dear Superintendent Hardy,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Linda Dvorak  
525 Sunset Ridge Rd  
Northfield, Illinois 60093 1025

Dear Superintendent Dvorak,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. - 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Nathaniel Wilson  
310 S Front St  
Kansas, Illinois 61933 6205

Dear Superintendent Wilson,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Superintendent Kevin Spain  
1900 W Monroe St  
Springfield, Illinois 62704 1531

Dear Superintendent Spain,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Marilyn Holt  
330 S Giant City Rd  
Carbondale, Illinois 62902 5042

Dear Superintendent Holt,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.

Sincerely,

Richard J. Durbin

Superintendent Mark Zahm  
8701 Menard Ave  
Morton Grove, Illinois 60053 3052

Dear Superintendent Zahm,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?

May 25, 2018

Superintendent Tori Lindeman  
400 S Old Rand Rd  
Lake Zurich, Illinois 60047 2459

Dear Superintendent Lindeman,

Over the past few years, there has been an alarming increase in vaping or electronic cigarette (e-cigarette) use among high school students nationwide. In Illinois, 27 percent of high school students now use these products. We write today to request information regarding what our Illinois middle and high schools are experiencing with respect to student use of these dangerous and addictive nicotine products.

From aggressively marketing cigarette and tobacco products near schools, to shamelessly using cartoon characters to entice children, and producing their tobacco products in kid-friendly candy and fruit flavors, it is no secret that big tobacco companies will stop at nothing to hook young people on their addictive and dangerous products. The good news is that, thanks to enhanced prevention and awareness policies, cigarette smoking among high school students is at record lows—dropping from 28 percent in 2000 to 8 percent in 2016. The bad news is that, much to our dismay, these gains are being jeopardized because of non-cigarette tobacco products—especially cigars and e-cigarettes with kid-appealing flavors.

Between 2011 and 2015, the use of e-cigarettes among high school students increased more than ten-fold—from 1.5 percent to 16 percent. While e-cigarette use by high school students declined slightly to 11.3 percent in 2016, e-cigarettes remain the most popular form of tobacco use among youth. This is especially concerning given that the National Academies of Sciences, Engineering, and Medicine found that there is “substantial evidence” that e-cigarette use increases the risk that youth will try cigarettes, and “conclusive evidence” that most e-cigarettes contain and emit numerous potentially toxic substances.

E-cigarette use among teenagers has become so prevalent that a number of high schools administrators across the country have been forced to take dramatic action in response. Some schools have banned USB drives from their campuses, as it is often difficult to differentiate them from certain vaping devices. Some schools have placed limitations on the number of students that can use the bathroom at one time, as young people congregate in bathroom stalls to secretly vape. Some schools have been forced to install additional security cameras in an effort to crack down on student use of e-cigarettes.

To help combat this alarming public health scourge, we have pressed the U.S. Food and Drug Administration (FDA) and Department of Health and Human Services (HHS) to expeditiously regulate these e-cigarette products and remove kid-friendly flavors from the market. We have also supported federal awareness efforts to educate the public about tobacco harms.

We write today to understand what your district is experiencing with respect to student use of e-cigarettes. We would greatly appreciate answers to the following questions by June 29, 2018 (and please feel free to ask your schools to provide as much additional context or anecdotal information as they see fit):

- 1) Have your middle or high schools noticed an increase of e-cigarette use by their students over the past few years? If so, what are the most popular devices and/or accompanying flavors?
- 2) Have your middle or high schools had to impose new rules, regulations, or practices in order to better contain or monitor the use of e-cigarettes among students?
- 3) Have parents of your middle and high school students raised this issue with your principals or teachers?
- 4) Have your middle or high schools taken any additional steps to educate students about the harms of tobacco use, as well as the addictive nature of nicotine found in e-cigarette flavorings? Please describe any specific sessions, events, or initiatives.
- 5) Do your middle and high school principals or teachers have any idea where their under-18 students are purchasing e-cigarettes? Are there convenient stores, or vaping stores, that sell these products near high schools?
- 6) Is there anything that your middle or high school principals and teachers think Congress could be doing at the federal level to help in your efforts to protect a new generation of children from becoming addicted to nicotine?

While it remains an open question whether e-cigarettes can play a role in helping adult smokers to quit cigarettes, there is certainly no role for them to play in our nation's schools—and yet that is exactly where they are turning up. We appreciate any information you and your high schools may be able to provide on this important subject. Please send your responses electronically to [Jessica McNiece@durbin.senate.gov](mailto:Jessica_McNiece@durbin.senate.gov) and [Josie Villanueva@duckworth.senate.gov](mailto:Josie_Villanueva@duckworth.senate.gov). Thank you.
